## Controller

## Mechanical block

## Control lever

## Lever gate

Standard lever gates

universal

"cross"

Examples of special lever gates

End stops

Handles

The controllers are units designed to control hoisting and materials handling equipment by grouping their electrical circuits.
They comprise adaptable sub-assemblies that enable the construction of many different versions.
Used in association with automation system equipment, they ensure the starting, acceleration and braking of the drive motors.
They are designed for fitting into portable controller stations or controller desks. The mounting is dust and damp protected.
Articulated mechanical assembly that holds the control lever, lever gate, actuating mechanism, cam carriers, contacts and potentiometer adaptation device.

Operating device that enables separate or simultaneous control of the movements. Fitted to it are dust and damp protecting bellows, the handle and mechanical and electrical safety devices that are actuated when the controller lever is returned to its zero (centre) position.

## 2 types of lever gate: <br> - Standard types:

- universal: allows the lever to move to its maximum travel in 1 or 2 directions simultaneously ("universal" or "8-direction" controller),
口 "cross" or "I" gates: only allow the lever to move to its maximum travel in 1 direction at a time.

■ Special types: related to the application, they are used to control the required combination of movements.

Additional devices for limiting the lever travel to a number of positions in a given direction.
a Simple handle: fixed knob screwed onto the control lever.
b1 Handle with zero (centre) position mechanical interlock.
Operation:
The knob of the handle comprises a fixed part (upper section) and a moving part
(lower section).
When the lever is in the zero (centre) position, it is mechanically locked by a sliding
rod within the lever.
To disengage the lock, the lower part of the handle is pulled upwards thus freeing the
rod. rod.
b2 Handle with zero (centre) position mechanical interlock + electrical contact.
Mechanical operation identical to that described above.
When the lever is in the zero (centre) position, the rod actuates a contact block.
The disengagement of the lock causes the contact(s) in the block to change state.
c1 "Dead man's" handle.
Operation:
The knob of the handle comprises a fixed part (lower section) and a moving part (upper section).
When the upper section of the knob is pushed downwards it pushes a sliding rod within the lever.
This rod actuates a moving bowl which, in turn, causes a contact block (located in the lower part of the mechanism) to change state and remain in this condition irrespective of the control lever position.
c2 Handle with built-in flush or projecting pushbutton (audible alarm type).
Mechanical operation identical to that described above.
The handle is fixed and it is only the pushbutton that operates the sliding rod.

| 3 | - | * |  |  |  |  |  |  | * |  |
| 4 |  | + | + |  |  |  |  |  |  |  |

Operating cycle

This is the direction of operation of the control lever away from its zero (centre) position towards one of 2 or 4 directions (either 2 directions directly in line or 4 directions at $90^{\circ}$ ).
Diagonal movement is the operation of 2 directions simultaneously.

The movement is the combination of 2 directions either side of the zero position that are directly in line.

This is the change of state of a contact block obtained by angular displacement of the control lever.

## Three different types of lever operation for each direction:

## 1 Notched positions, with stayput operation.

The control lever is moved notch by notch from its zero (centre) position to its maximum travel position in the required direction.
The lever maintains its position when the operator releases the handle.

## 2 Notched positions, with spring return to zero operation.

Notched operation identical to that described above but with an automatic device that returns the lever to its zero (centre) position when the operator releases the handle. 3 Unnotched positions, with spring return to zero operation.
The control lever of the controller is moved from its zero (centre) position to its maximum travel position in the required direction without notching. Irrespective of its position, the lever spring returns to the zero (centre) position when the operator releases the handle.

When designing the scheme take into account that all contacts are closed until actuated (opened) by an operating cam.

The contact blocks are actuated by a series of various length cams which are arranged to provide the required scheme.
These cams can either be:
$\square$ variable composition, i.e. comprising different sub-assemblies mounted on a cam carrier,
a predetermined, i.e. for a function that is widely used in conventional schemes.
Example: reversing cams for direction of operation.

## Cam carriers

Mechanism designed for mounting cams on for controllers with variable composition cams.

## Cam actuation of contacts

When actuated by the cam lobe, the contact opens thus ensuring positive opening operation. Therefore, the presence of a cam corresponds to the absence of a cross or line on the scheme.

## Example of graphic representation of a scheme

The various methods for indicating the operating sequence of the contacts are represented by schemes in accordance with IEC 113-4 or IEC 337-2A (section 2). The ordering grids for XK controllers are designed in accordance with IEC 337-2A (section 2).
Take particular note of the way an assured electrical overlapping is represented as is shown for contacts 2 and 4 between positions 2 and 3 (see diagram to left).

An operating cycle applied from an initial common O position is the passing from this initial position to the extreme position in each direction and subsequent return to the initial O position.

Compact and lightweight units, designed to control "light hoisting" and materials handling equipment. Mainly for use in portable stations.
2 models:
■ XKB A: controllers with predefined, non modifiable, scheme.
■ XKB E: controllers with variable composition schemes.

## Control lever

Length: 130 mm . Travel in each direction: $28^{\circ}$ maximum.

## Lever gate

Universal and modifiable.
Specific, by adding half-gates to the universal lever gate (referenced by letter) 9 main combinations. .

## End stops

The total lever travel can be limited to $20^{\circ}$ or $12^{\circ}$ by using removable end stops (XKB Z972 for $20^{\circ}$, XKB Z971 for $12^{\circ}$ ) when the lever gate comprises half-gates $Y$ or Z.

## Handles

■ Simple handle with zero (centre) position contact (closed at zero).

- Handle with zero (centre) position mechanical interlock + contact (closed at zero).

■ "Dead man's" handle with contact (open when handle released).

- Handle with built-in flush or projecting pushbutton and contact (open when pushbutton or handle released).
Note: it is important to decide which type of handle is required when selecting the controller, since modification cannot be affected after installation.

## Electrical positions

3 positions maximum in each direction.

## Types of lever movement

■ Notched positions, with stayput operation: 3 notches maximum in each direction ( $12^{\circ}, 20^{\circ}, 28^{\circ}$ ).
$■$ Notched positions, with spring return to zero operation: 3 notches maximum in each direction $\left(12^{\circ}, 20^{\circ}, 28^{\circ}\right)$. (XKB E: only 1 contact may be used at each notch.) - Unnotched positions, with spring return to zero operation: $28^{\circ}$ maximum travel in each direction. (XKB E: only 1 contact may be used for each spring return to zero position.)

## Contacts

The contact blocks used for establishing the scheme are located in a monobloc assembly. There are 2 types:

- Block with 4 contacts per movement.
- Block with 4 contacts per movement +1 zero (centre) position contact.

For both types, an additional contact is available. Its function depends on the type of handle.

## Cam schemes

- XKB A: standard schemes can be established using predefined cams. These cams are moulded and cannot be modified.
2 versions:
- Using a block with 4 contacts per movement: 2 reversing cams and 2 function cams per movement.
- Using a block with 4 contacts per movement +1 zero (centre) position contact:

2 reversing cams and 2 function cams per movement +1 zero (centre) position cam.

- XKB E: special schemes can be established using snap-on cams (for each position) mounted on cam carriers. (overlapping contact operation is not possible). 2 versions:
- Using a block with 4 contacts per movement: 4 variable composition cams per movement.
- Using a block with 4 contacts per movement +1 zero (centre) position contact: 4 variable composition cams per movement + 1 fixed composition zero (centre) position cam.

## Legend

One $100 \times 100 \mathrm{~mm}$ anodised aluminium legend plate with matt satin finish.
Standard "hoist-long travel" and "traverse-slew" symbols or text (to be stated on Order form, see page 13).

## Potentiometer adaptation

■ 2 potentiometers maximum per movement when using block with 4 contacts per movement.
■ 1 potentiometer maximum per movement when using block with 4 contacts per movement +1 zero (centre) position contact.

Separate components

Controllers
For "light hoisting" applications, type XKB
Separate components

XKD F

Compact and fully configurable units designed to control "medium hoisting" equipment.
Mainly for use on fixed control stations or seated controller desks type XJC. 1 model:
■ XKD F: controller with variable composition schemes.

## Control lever

Length: 200 mm . Travel in each direction: $36^{\circ}$ maximum.

## Lever gate

Integral, non removable, part of the mechanical block. Must be specified on the Order form.

## Handles

■ Simple handle.

- Handle with zero (centre) position mechanical interlock.

■ Handle with zero (centre) position mechanical interlock + $1 \mathrm{C} / \mathrm{O}$ snap action contact.
■ "Dead man's" handle + slow break contact(s).
■ Handle with built-in flush or projecting pushbutton + slow break contact(s).

## Angular electrical positions

- 6 positions maximum in each direction.

Types of lever movement
■ Notched positions, with stayput operation
2 versions:

- 5 notches maximum in each direction, at $12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}$ and $36^{\circ}\left(6^{\circ}\right.$ per notch), only when used with variable composition cam carriers comprising 4 or 8-contact blocks ( $1^{\text {st }}$ notch at $6^{\circ}$ ).
- 3 notches maximum in each direction, at $12^{\circ}, 24^{\circ}$ and $36^{\circ}$ ( $12^{\circ}$ per notch), only when used with variable composition cam carriers comprising 2-contact blocks.
Note: It is possible to use, on the same movement, a " 5 notch max." cam carrier combined with a "3 notch max." cam carrier. The lever operation is " 5 notch" type.
■ Notched positions, with spring return to zero operation
3 or 5 notches maximum in each direction depending on the versions stated above. $\triangle 4$ simultaneous contacts max. with spring return can be used at the $1^{\text {st }}\left(12^{\circ}\right)$ notch. ■ Unnotched positions, with spring return to zero operation
$36^{\circ}$ maximum travel in each direction.
© 2 simultaneous contacts maximum with spring return can be used at $6^{\circ}$ and then 4 contacts maximum at each subsequent $6^{\circ}$ position.

## Contacts

16 contacts maximum per movement.
The contact blocks are mounted in pairs on a fixing plate.

## Cam schemes

2 versions:
■ Variable composition cams, $6^{\circ}$ per position; 4 or 8-contact cam carriers.

- From 1 to 5 mechanical positions.
$\square$ Overlapping contact operation possible (see graphic representation on page 9) except between the $4^{\text {th }}$ and last position.
■ Variable composition cams, $12^{\circ}$ per position; 2-contact cam carriers.
- From 1 to 3 mechanical positions.
- The contacts can be actuated $6^{\circ}$ by $6^{\circ}$ approx., except under the following conditions:
For technical reasons, it is essential to have at least 3 spaces on the electrical scheme for the same contact.
2 possible examples

2 impossible examples

The 2-contact cam carriers are compact and do not increase the size of the mechanical block base.

## Legend

One $120 \times 120 \mathrm{~mm}$ anodised aluminium legend plate with matt satin finish. Text to be stated on Order form.

## Potentiometer adaptation

2 potentiometers maximum per movement:
$\square$ mounted directly on the mechanical block when used with 2-contact variable composition cams,
$\square$ mounted at the extremity of the contact supports when used with 4 and 8 -contact variable composition cams.

Electrical overlapping of contacts is not possible between the $5^{\text {th }}$ and $6^{\text {th }}$ notches.

- Spring return operation: 2 simultaneous contacts maximum with spring return can be used at $6^{\circ}$ and then 4 contacts at each subsequent $6^{\circ}$ position.

## Controllers

For "medium hoisting" applications, type XKD F
Controller selection example

## Requirement

A 2 movement controller: "hoist-traverse".
"Cross" type lever gate. Controller conforming to NF E 52-070.
No potentiometer adaptation on movements $A B$ or CD.

## Scheme for movement AB "hoist"

## Scheme for movement CD "traverse"

## Notes:

Movement AB
The scheme for movement $A B$ requires 7 contacts, therefore, select 4 blocks of 2 contacts.
The only alternative is the selection of either drum $n^{\circ} 3$ or $n^{\circ} 1$, depending on the available space.
Movement CD
The space between each notch indicated on the 3 position scheme cannot be adhered to.
Effectively, to obtain 5 contacts, a 2-contact block can be selected (drum $n^{\circ} 2$ ), which does not increase the size of the base, together with $2 \times 2$-contact blocks (drum n ${ }^{\circ} 4$ ).
The lever gate will limit the lever travel to 3 notches.

## Composition of the reference (see page 20)

Without adaptation nor potentiometer

Controllers
For "medium hoisting" applications, type XKD F
Separate components

XKM B

Extremely robust and fully configurable units designed to control "heavy hoisting" equipment.
Mainly for use on fixed control stations or seated controller desks type XJC.
3 different controller models:

- XKM A: with variable composition schemes, multidirectional control of 2 movements by central lever.
- XKM B: with variable composition schemes, control of 1 movement by central lever.
- XKM C: with variable composition schemes, control of 1 movement by side lever.

Control lever
XKM A and XKM B: length: 200 or 250 mm . Travel in each direction: $36^{\circ}$ max.
XKM C: side lever, length 240 mm . Travel in each direction: $54^{\circ}$ maximum.

## Lever gate

XKM A: universal or specific (must be specified on Order form).
XKM B and XKM C: no lever gate.

## End stops

Removable, attached to mechanical block to limit lever travel in $6^{\circ}$ steps.

## Handle

XKM A and XKM B; 5 versions:
■ Simple handle.

- Handle with zero (centre) position mechanical interlock.

■ Handle with zero (centre) position mechanical interlock + 1 C/O snap action
contact.
■ "Dead man's" handle with 1 C/O snap action contact.

- Handle with built-in flush or projecting pushbutton $+1 \mathrm{C} / \mathrm{O}$ snap action contact.

XKM C: simple handle.

## Electrical positions

XKM A and XKM B: 6 positions maximum in each direction.
XKM C: 9 positions maximum in each direction.
Type of lever movement
■ Notched positions, with stayput operation.
XKM A and XKM B; 2 versions:

- 6 notch sector in each direction: $6^{\circ}, 12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}, 36^{\circ}$.
- 5 notch sector in each direction: $12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}, 36^{\circ}$.

Note: two different notching forces: Normal: operating lever force: 2 daN. Increased: operating lever force: 4 daN (for 4 simultaneously operated contacts).

## XKM C, 2 versions:

- 9 notch sector maximum in each direction: $6^{\circ}, 12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}, 36^{\circ}, 42^{\circ}, 48^{\circ}, 54^{\circ}$.
- 8 notch sector maximum in each direction: $12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}, 36^{\circ}, 42^{\circ}, 48^{\circ}, 54^{\circ}$.
- Notched positions, with spring return to zero operation.

XKM A, B and C, 2 versions:

- 6 notches maximum in each direction: $6^{\circ}, 12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}, 36^{\circ}$.
$\square 5$ notches maximum in each direction: $12^{\circ}, 18^{\circ}, 24^{\circ}, 30^{\circ}, 36^{\circ}$.
$\triangle 2$ simultaneous contacts maximum with spring return can be used at $6^{\circ}$ and then 4 contacts maximum at each subsequent notch.
■ Unnotched positions, with spring return to zero operation:
XKM A, B and C: $36^{\circ}$ maximum travel in each direction.
© 2 simultaneous contacts maximum with spring return can be used at $6^{\circ}$ and then 4 contacts maximum at each subsequent $6^{\circ}$ position.

## Contacts

24 contacts maximum per movement ( $2 \times 3$ blocks of 4 contacts).
2 versions:

- Standard, double-break contacts.
- Double-break contacts with magnetic blow-out.

## Cam schemes

24 cams maximum per movement (12 contacts on each side), mounted in groups of 4. Warning: for technical reasons relating to mounting, the first cam (for contact 13-14) must be a reversing or zero position cam.

## Legends

1 for each direction, interchangeable without dismantling the unit.
Material: anodised aluminium, anodic oxidation marking.
Standard markings: FORWARD, REVERSE, RAISE, LOWER, LEFT, RIGHT. Other markings: to be stated on Order form.

## Potentiometer adaptation

2 potentiometers maximum per movement.
Potentiometers mounted at the extremity of the contact supports or directly onto the faces of the mechanical block.

## Controllers

For "heavy hoisting" applications, type XKM

Environment

## Conformity to standards

## Presentation

The control devices being used in hoisting equipment have played a major role in their rapid development. Increased speeds, acceleration and deceleration have considerably improved the performance and capabilities of hoisting equipment, but it is important to ensure that this advancement does not effect the safety of persons or material by reducing to a minimum the effort required by the operator, in order to avoid fatigue.

It is therefore essential that the operator not only has controllers that are easy to operate, accurate and robust enough for intensive duty hoisting applications (types XKB, XKD and XKM) but also, that these controllers are located in a zone with particularly easy access, referred to as the "comfort zone".

Scientific research regarding working conditions and the relationship between operators and their workstations has revealed that comfort is imperative and this has been taken into account in the design of the ergonomic Telemecanique controller desks type XJC (registered design).

The controller desks are available in both rotating (1) and fixed versions. For both versions, a standardised range of enclosures of various widths enables requirements to be met not only for installation in cabins of "heavy hoisting" overhead cranes, where space is not usually restricted, but also in cabins of tower cranes and public works equipment where space is often very restricted.

The various control units (controllers, wobblesticks, pushbuttons, pilot lights, indicators, etc.) are installed on standardised removable top plates, thus avoiding making cut-outs directly on the controller desk itself.
(1) For safety and ergonomic reasons (relating to stability), the rotating mechanism used is of the frictional type. However, for certain applications a roller bearing mechanism can be used on request. Please consult your Regional Sales Office.

XKB A for "light hoisting" applications

XKD F for "medium hoisting" applications

XKM A for "heavy hoisting" applications

## Presentation (continued)

Three types of controllers can be fitted into the stations or desks.
■ XKB: controller with predefined or variable composition schemes with 2 contacts in each direction;
This unit is particularly designed for "light hoisting" equipment or auxiliary functions.

XKD: controller with variable composition schemes, depending on requirement, with 16 contacts per movement.
This unit is particularly designed for "medium hoisting" equipment or auxiliary functions.

■ XKM: controller with variable composition schemes with 24 contacts per movement, to meet the intensive duty requirements of heavy industry. This unit is designed exclusively for controller desks XJC.

Note: in order to fulfil the ergonomic requirements of the user, controllers XKM used in control desks must be fitted with short control levers.

Note: whenever the terms "right-hand" or "left-hand" are used in this catalogue, reference is being made to their positions as shown in the diagram below. It determines the position of the engraving on the controller legends.

XJP Z922
XJP Z902
XJP Z922

## Presentation

Portable controller stations XJP comprise a yellow, glass-reinforced polyester, enclosure that can be fitted with 2 controllers type XKB and up to $8 \times \varnothing 22$ control and signalling units.
Degree of protection: IP 54.

## Weight:

- Empty station with cable boot: 2 kg .
- Fitted station: approximately 4 kg .

2 models:
■ XJP A5: enabling the mounting of controllers XKB fitted with 4-contact blocks per movement, with or without potentiometers.
■ XJP A6: enabling the mounting of controllers XKB fitted with 4-contact blocks per movement +1 zero (centre) position contact, without potentiometers.

## Carrying device

Either a polyamide harness, adjustable at $60^{\circ}$ intervals, or a rigid chest frame with adjustable harnesses.

## Protection device

2 metal loop guards that fix onto each end of the station assure protection and can also be used as grips.

## Cabling device

Rubber cable boot mounted on side of station, for $\varnothing 10$ to 22 mm or $\varnothing 19$ to 26 mm cable, or mounted on the base of the station (left or right-hand side), for $\varnothing 20 \mathrm{~mm}$ cable.

## Type XJ9 BA for controllers XKB and <br> $\varnothing 22 \mathrm{~mm}$ or $\varnothing 30 \mathrm{~mm}$ pushbuttons, switches and pilot lights

XJ9 BA1

XJ9 BA2

## Presentation

The portable controller stations comprise either 1 (XJ9 BA1) or 2 (XJ9 BA2) yellow, laminated polyester, enclosure(s). Each enclosure can be fitted with a controller type XKD and control and signalling units.
2 models:
■ XJ9 BA1: 1 to $7 \varnothing 22$ units or 1 to $5 \oslash 30$ units,
■ XJ9 BA2: 1 to $6 \varnothing 22$ units or 1 to $4 \varnothing 30$ units.
Degree of protection: IP 54.
Weight:

- XJ9 BA1: empty station with cable boot: 3.5 kg .
- XJ9 BA1: fitted station: approximately 7.5 kg .
- XJ9 BA2: empty station with cable boot: 4.5 kg .
- XJ9 BA2: fitted station: approximately 8.5 kg .

## Carrying device

■ XJ9 BA1: rigid chest frame with adjustable harness.
■ XJ9 BA2: adjustable tubular shoulder frame.

## Cabling device

Controller desk XJC 6 fitted with "high comfort" seat

## Presentation

The basic fixed controller desk XJC C6 comprises two enclosures, both with forward raked top panel, fixed to the floor either side of a "high comfort" seat.
■ Paint finish: "hammered".
■ Weight of each enclosure: 14 kg .

- Degree of protection: IP 54.
"High comfort" seat
- Helical spring suspension with double-action hydraulic shock absorbers.
- Vertical suspension travel of 100 mm .

■ Manual adjustment to suit weight of operator from 50 kg to 120 kg .
■ Seat height and rake adjustment of 60 mm .

- Adjustable rake backrest.

■ Forward/back adjustment of 160 mm .
■ Suspension cover.

- Fold-up armrests with adjustable inclination.
- Adjustable headrest.
- Control levers positioned at front.

■ Top quality fabric upholstery (grey/black).
